

Voicekey launches Voice verified Password Reset on the global market place.

Voicekey Ltd, an Innovative UK cyber security enterprise has launched its three-factor mobile identity management solution. The integration of voice biometrics and smartphone devices creates a simple but secure means of resetting passwords - Anytime, Anywhere.

According to recent studies, many people use a single password across multiple applications simply because they are unable to remember more than three passwords.

This human failing is at odds with modern IT security requirements, which require regular password changes. As a result up to 60% of the traffic to help desks can be for password reset with costs typically in the order of \$60 per incident

Voicekey's self-service Password Reset manager (VoicekeyPR) changes all of this. Voice is a biometric that people are happy to share and it can be efficiently captured wherever and whenever a user wants to connect to secure IT systems and is particularly suitable for today's mobile environment.

VoicekeyPR allows end-users to automatically reset their Windows Active Directory password from a smart phone or tablet device using their voice.

This unique form of password reset offers the following:

- Simplified user experience – Fast authentication.
- Available 24/7 – The service is location and time independent.
- Flexible and Easy Active Directory integration and deployment
- Enhanced security – Improved security through multi-factor verification.
- Reduced Help Desk costs – typical cost \$3 per users per annum
